Magnetic and Fluorescent Microspheres
About Ocean NanoTech

Ocean NanoTech is devoted to the mass production of nano/micro-sized particles, as well as their applications in healthcare and life science. It provides a variety of magnetic and fluorescent particles for:

- Immunoassay
- Nucleic acid isolation
- NGS library preparation
- PCR cleanup and size selection
- Immunoprecipitation
- Cell separation

With its core competences in preparation, surface modification, and bioconjugation of nano/micro-sized particles, Ocean NanoTech also provides custom solutions and OEM services to both academia and industry.
Magnetic Beads

Ocean NanoTech uses excellent size control techniques to provide three series of superparamagnetic beads — Mono Mag, Hi Sur Mag, and Super Mag — with sizes ranging from 50 nm to 5 µm. These magnetic beads are modified with different functional groups or ligands to meet different customer needs.

Other features include:

- High density of functional groups, such as amine and carboxylic acid, are derived for high binding capacity
- Optimized iron content (30-80% depending on size) for short separation time and long settlement time
- Pre-blocked with a layer of polymer for ligand immobilization with significantly low non-specific binding

Selection of Mono Mag, Hi Sur, and Super Mag

Non-specific binding — All the magnetic beads offered by Ocean NanoTech are pre-blocked, which makes them an ideal platform for ligands immobilization with significantly low non-specific binding. Among the magnetic beads Mono Mag has the lowest non-specific binding.

Iron exposure — Mono Mag has a layer of hydrophobic coating to seal the iron oxide from the outer environment and has the lowest iron exposure among the magnetic beads.

Separation and Settlement

<table>
<thead>
<tr>
<th>Magnetic Bead</th>
<th>Separation Time</th>
<th>Settlement Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super Mag 50 nm</td>
<td>2-8 hours</td>
<td>&gt; 6 months</td>
</tr>
<tr>
<td>Super Mag 100 nm</td>
<td>5-10 minutes</td>
<td>30 days</td>
</tr>
<tr>
<td>Super Mag 150 nm</td>
<td>2-5 minutes</td>
<td>16 days</td>
</tr>
<tr>
<td>Super Mag 200 nm</td>
<td>1-2 minutes</td>
<td>7 days</td>
</tr>
<tr>
<td>Mono Mag 1 µm</td>
<td>&lt;1 minute</td>
<td>6 hours</td>
</tr>
<tr>
<td>Hi Sur Mag 1 µm</td>
<td>1-2 minutes</td>
<td>12 hours</td>
</tr>
</tbody>
</table>

Note: The separation time is measured by resuspending magnetic beads in a microcentrifuge tube and placing it in a permanent magnetic separator (1.5T). The settlement time is measured after 50% of the magnetic beads settle to the bottom of a cuvette. Protein and other ligand-conjugated magnetic beads may have a different settle time.

Mono Mag and Hi Sur Mag

Mono Mag has the lower non-specific binding and lower iron exposure. While Hi-Sur Mag has around four times larger surface area than the same weight of Mono Mag 1 µm. The feature of high surface area on Hi-Sur Mag enable its higher binding capacity than Mono Mag in the applications of protein or nucleic acid isolation.
Mono Mag Carboxyl Beads

Ocean NanoTech’s Mono Mag carboxyl functionalized magnetic beads are uniform, superparamagnetic beads with a layer of biocompatible polymer coating. The outer layer of its biocompatible coating makes them an ideal platform for ligands immobilization with significantly low non-specific binding.

Applications
- Immunoassay
- Immunoprecipitation
- Nucleic acid hybridization
- Western blot
- Cell separation

Feature 1. Significantly low non-specific binding

Note: Mono Mag carboxyl beads from Ocean NanoTech (MC1000) shows significantly lower non-specific binding. All beads were incubated for 1 hour with BSA at a ratio of 1 mg beads to 150 µg BSA.
Note: Mono Mag Carboxyl Beads XC1000 shows higher binding capacity in multiple chemiluminescent assays.

Feature 2. High binding capacity

Feature 3. High iron content and fast separation

Note: Mono Mag Carboxyl Beads XC1000 have faster separation. At t50 (s) is when 50% of beads have been magnetically separated. At t90 (s) is when 90% of beads have been magnetically separated.

Figure 1. Significantly low non-specific binding

Hi-Sur Mag Carboxyl Beads

Ocean NanoTech’s Hi-Sur Mag Carboxyl Beads are hydrophilic magnetic beads with carboxylic acid groups. These surface groups allow covalent amide bond formation to proteins/peptides via primary amine (NH$_2$) groups. Oligonucleotides, antibodies, or other ligands with amine groups can be easily coupled to the beads for use in many downstream applications including protein purification, DNA sample preparation and clean up, proteomics and immunoassays. Activation through carbodiimide is required. Attribute to their very large surface area (about three times larger than that of Mono Mag Carboxyl Beads, 1 µm, MC1000) and unique surface coating, Hi-Sur Mag Carboxyl Beads exhibit superior binding capacity and low non-specific binding of protein or nucleic acids.

Features
- Superior binding capacity
- High surface area (4 times larger than that of Mono Mag Streptavidin Beads)
- Low non-specific binding
- Fast magnetic separation
- Convenient one-step or two-step coupling.
- Available in three different carboxyl densities to meeting different needs

Applications
- Immunoprecipitation
- Nucleic acid isolation
- Assay development

Specifications
- Concentration: 50 mg/ml
- Size: 1 µm (optional)

Storage and Usage
- Store at 2-8°C. Freezing of particles may result in irreversible aggregation and loss of binding activity.
- Ensure the suspension is well dispersed prior to use, bath sonication is strongly recommended, as particles are expected to settle during storage.

Super Mag Carboxyl Beads

Ocean NanoTech’s Super Mag carboxylic acid modified magnetic beads are superparamagnetic beads with a layer of biocompatible coating which makes our magnetic beads an ideal platform for ligand immobilization with significantly low non-specific binding. High density of carboxylic acid groups is derived to maximize the binding capacity of the magnetic beads.

Applications
- CTC separation
- Cell separation
- Protein separation
- Bacteria separation
- Immunoassays

Features
- High binding capacity
- Extremely slow sedimentation rate
- Shorter magnetic separation time than beads with the same size from other suppliers
- Low non-specific binding
- Convenient one-step or two-step coupling
- Iron oxide content: ~ 80%

Specifications
- Concentration: 10 mg/ml
- Size: 50 nm, 100 nm, 150 nm, 200 nm

Storage and Usage
- Store at 2-8°C. Freezing of particles may result in irreversible aggregation and loss of binding activity.
- Ensure the suspension is well dispersed prior to use, bath sonication

Mono Mag Streptavidin Beads

Ocean NanoTech provides both hydrophilic and hydrophobic Mono Mag Streptavidin Beads. A monolayer of streptavidin is covalently coupled to their surface and makes most of the biotin binding sites sterically available for binding of biotinylated antibodies, nucleic acids, or other biotinylated ligands and targets.

Applications
- Chemiluminescent assay
- ELISA
- Immunoprecipitation
- Nucleic acid isolation
- Cell separation

Features
- High binding capacity: > 30 µg biotinylated BSA or IgG per mg beads
- Low non-specific binding
- Narrow size distribution: CV ≤ 5%

Pull-down of biotinylated IgG spiked in cell lysate with Mono Mag Streptavidin Beads (MV1000). Pulldown efficiency was evaluated by SDS-PAGE. Almost all the spiked biotin-IgG was captured by MV1000. Meanwhile, most of the impurities remained in the flow through, which indicated the high binding capacity and low nonspecific binding of the Mono Mag. However, majority of the biotin-IgG remained in the supernatant and cannot be captured by the beads from leading brand A. The BSA absorbed on the beads from leading brand A are not stable and can be eluted by SDS.

Note: Higher binding capacity and low non-specific binding of Mono Mag Streptavidin beads (MV1000)

**Hi-Sur Streptavidin Beads**

Ocean NanoTech’s Hi-Sur Streptavidin Beads (1 µm, HV1000) are hydrophilic magnetic beads with a monolayer of streptavidin. It is covalently coupled to their surface and makes most of the biotin binding sites sterically available for binding of biotinylated nucleic acids, antibodies, or other biotinylated ligands and targets. Attributes to their very large surface area and unique surface coating, Hi-Sur Mag Streptavidin Beads exhibit superior binding capacity and significantly low non-specific binding.

**Applications**

- Immunoprecipitation
- Nucleic acid isolation
- Assay development

**Features**

- High capacity: > 50 µg biotinylated IgG per mg beads
- Large surface area: 3 or 4 times larger than that of Mono Mag Streptavidin Beads
- Low non-specific beads

**Specification**

- Concentration: 10 mg/ml
- Size: 1 µm (nominal)

**Storage and Usage**

- Store at 2-8°C. Freezing of particles may result in irreversible aggregation and loss of binding activity.
- Ensure the suspension is well dispersed prior to use, bath sonication is strongly recommended, as particles are expected to settle during storage.

**Note:** Signal to noise and sensitivity of MV1000 in cardiac troponin cTnT assay.

Super Mag Streptavidin Beads

Ocean NanoTech’s Super Mag Streptavidin Beads are hydrophilic magnetic beads with a monolayer of streptavidin. It is covalently coupled to their surface and makes most of the biotin binding sites sterically available for binding of biotinylated antibodies, nucleic acids, or other biotinylated ligands and targets. The high-affinity interaction between streptavidin and biotin is used in a vast number of applications.

Applications
- Cell separation
- Immunoprecipitation
- Immunoassay

Pull-down of biotinylated IgG spiked in cell lysate with Hi-Sur streptavidin beads (HV1000). Pulldown efficiency was evaluate by SDS-PAGE. Almost all the spiked biotin-IgG was captured by the beads from HV1000 and most of the impurities remained in the flow through, which indicated the high binding capacity and low non-specific binding of the Hi-Sur Mag.
Magnetic Beads

Features
- High Binding Capacity: > 40 µg biotinylated BSA or IgG per mg beads (SV0050)
- Extremely slow sedimentation rate
- Shorter magnetic separation time than the beads with the same size from other suppliers.
- Low non-specific binding

Specifications
- Concentration: 10 mg/ml
- Size: 1 µm (nominal)

Storage and Usage
- Store at 2-8°C. Freezing of particles may results in irreversible aggregation and loss of binding activity.
- Ensure the suspension is well dispersed prior to use, bath sonication is strongly recommended, as particles are expected to settle during storage.

Note: Signal to noise and sensitivity of MV1000 in cardiac troponin cTnT assay.
